

ABSTRACT OF THE DISCLOSURE

An emergency message system provides a system and method for generating and transmitting emergency messages. In one embodiment, the emergency message system employs a transceiver network with a plurality transceivers coupled to monitoring devices residing at a plurality of customer premises. Control room operators receive an emergency message from an identifiable transceiver. The transceiver, identified by an identification code, indicates a location and the nature of the emergency condition so that the control operators may request appropriate emergency assistance.
